# Apply filters to SQL queries

### Project description

Using SQL filters, I will examine potential security issues involving log in attempts and employee machines. Additionally, I will identify employee machines for security updates from specific departments and dates.

### Retrieve after hours failed login attempts

I recently discovered a potential security threat that occurred after business hours. The query below selects all (\*) columns from the log\_in\_attempts table. I am interested in viewing failed login attempts made after '18:00' hours. Therefore, I use the *Where* filter with '>' and '18:00' while also including 'AND' to filter for failed login attempts (0) in the success column. The 'AND' filter indicates that both conditions must be satisfied.

-> WHERE login_time > '18:00' AND success = 0;

### Retrieve login attempts on specific dates

A suspicious event occurred on 2022-05-09. I analyzed this date and the day before (2022-05-08). This query selects all (\*) from the log\_in\_attempts table. I filter using the WHERE and the OR filters to retrieve login information from the login\_date column for both of these

days. The OR filter indicates that either string could be satisfied. Additionally, I used single quotes (') for the date to indicate the beginning and end of a string.

MariaDB [organization]> SELECT * -> FROM log_in_attempts											
-> WHERE login_date = '2022-05-08' OR login_date = '2022-05-09';											
+   event_id   +	username	login_date	login_time	country	ip_address	++   success   +

## Retrieve login attempts outside of Mexico

It was determined that the suspicious activity did not originate from Mexico. I selected all from the log\_in\_attempts table. I used the WHERE NOT filters in conjunction with the LIKE filter to indicate that the country is not like, or similar to, Mexico. Mexico can be found in the column as 'Mex' and 'Mexico'. Therefore, I used the % after MEX to retrieve data from that column containing strings that begin with MEX. If there were only one option available from the country column such as Mexico, I could have used the '=' to indicate which country it equated to.

```
MariaDB [organization] > SELECT *
    -> FROM log_in_attempts
    -> WHERE NOT country LIKE 'MEX%';
 event id |
                        login_date | login_time |
                                                    country | ip_address

## Retrieve employees in Marketing

The security team wanted to perform security updates on machines in the Marketing department in the East building. This SQL query selects all from the employees table. The WHERE statement is used to identify the specified column (department) and we want it to pull from only where the department equals (=) Marketing. Additionally, these machines from the Marketing department must be located in the 'East' building. The % sign is used to locate buildings that begin with East and have varying office numbers that follow.

```
MariaDB [organization] > SELECT
    -> FROM employees
    -> WHERE department = 'Marketing'
                                       AND office
  employee id | device id
                                                         office
                                username
                                           department

### Retrieve employees in Finance or Sales

The security department needed to do a different security update on machines in the Finance and Sales departments. Again, requesting all from the employees table, we must call the WHERE function and specify these departments. Note: It is necessary to indicate which column you are querying for each department.

```
MariaDB [organization] > SELECT *
    -> FROM employees
    -> WHERE department = 'Finance' OR department
  employee id |

## Retrieve all employees not in IT

The security team needed to make updates to all employee machines except for those within the Information Technology department, which already received their updates. This SQL query involves indicating WHERE (which column) and applies the NOT function to exclude the specified string from that column. In this case, that was the 'Information Technology department'.

```
MariaDB [organization] > SELECT *
    -> FROM employees
    -> WHERE NOT department =
 employee id | device id
                                                          office

## Summary

The security team was able to successfully identify failed login attempts made after hours, on specific dates, and filter by country. Additionally, the security team identified employee machines requiring updates from the Sales, Finance, and all other departments to exclude the Information Technology department.
